**Scoring of dual fluorescein and ICG
inflammatory angiographic signs for
the grading of posterior segment
inflammation**

**(Dual Fluorescein and ICG Angiographic
Scoring System for Uveitis).**

- Angiographic imaging of the posterior segment is essential in the appraisal of intraocular inflammation.
- Fluorescein angiography (FA) and indocyanine green angiography (ICGA) are well established techniques that are widely used in the clinic and in studies of various intraocular inflammatory diseases.
- They are useful in assessing the activity of the inflammatory process, in identifying the focus, extent, and complications of inflammation, in elucidating the cause(s) of visual loss, and in monitoring response to treatment.
